

SOLUTIONS TO MIDTERM #1, MATH 300

1. (9 marks) Answer true or false to the following questions by putting either true or false in the boxes. If the answer is true give a proof, and if the answer is false give a counter-example.

- (a) $\text{Log } e^z = z \ \forall$ complex numbers z .
 (b) $\left(\sqrt{2} \cos \frac{\pi}{6} + i\sqrt{2} \sin \frac{\pi}{6}\right)^4 = -2 + 2\sqrt{3}i$.
 (c) $\text{Arg}(z_1 z_2) = \text{Arg}(z_1) + \text{Arg}(z_2) \ \forall$ complex numbers z .

Solution:

- (a) FALSE. For example $\text{Log } e^{2\pi i} = 0 \neq 2\pi i$. In class we proved that

$$\text{Log } e^z = z \iff -\pi < y \leq \pi.$$

- (b) TRUE. By De Moivre's theorem

$$\left(\sqrt{2} \cos \frac{\pi}{6} + i\sqrt{2} \sin \frac{\pi}{6}\right)^4 = (\sqrt{2})^4 \left(\cos \frac{4\pi}{6} + i \sin \frac{4\pi}{6}\right) = -2 + 2\sqrt{3}i.$$

- (c) FALSE. This would be true if all 3 values $\text{Arg}(z_1 z_2), \text{Arg}(z_1), \text{Arg}(z_2)$ were in the interval $(-\pi, \pi]$. An example where it is not true is $z_1 = z_2 = e^{2\pi i/3}$.

2. (9 marks) The following questions require little or no computation.

- (a) Let $f(z) = u(x, y) + iv(x, y)$ be an entire function. What are the Cauchy-Riemann equations?
 (b) Express $\text{Log}(\sqrt{3} + i)$ in the form $a + bi$.
 (c) Find the principal value of $(1 + i)^{1+i}$.

Solution:

- (a) The Cauchy-Riemann equations for an analytic function $f(z) = u(x, y) + iv(x, y)$ are

$$\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}, \quad \frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}.$$

- (b) $\text{Log}(\sqrt{3} + i) = \text{Log}(2e^{\pi i/6}) = \ln 2 + \pi i/6$.

- (c) The principal branch of $(1 + i)^{(1+i)}$ is by definition

$$\begin{aligned} (1 + i)^{(1+i)} &= e^{(1+i)\text{Log}(1+i)} = e^{(1+i)\text{Log}(\sqrt{2}e^{\pi i/4})} \\ &= e^{(1+i)(\ln \sqrt{2} + \pi i/4)} = e^{(\ln \sqrt{2} - \pi/4)} e^{i(\ln \sqrt{2} + \pi/4)} \end{aligned}$$

3. (9 marks) Find all solutions of the following equations. Express your answers in the form $a + bi$.

(a) $\frac{1+z^2}{1-z^2} = i$.

(b) $z^3 + 1 = 0$.

(c) $\cos z = 2i \sin z$.

Solution:

(a) $\frac{1+z^2}{1-z^2} = i \iff z^2 = \frac{i-1}{i+1} = i \iff z = \sqrt{i} = \pm \frac{i+1}{\sqrt{2}}$.

(b)

$$\begin{aligned} z^3 + 1 = 0 &\iff z = -1, -\omega, -\omega^2 \left(\text{where } \omega = e^{2\pi i/3} = -\frac{1}{2} + \frac{\sqrt{3}}{2}i \right) \\ &\iff z = -1, \frac{1}{2} - \frac{\sqrt{3}}{2}i, \frac{1}{2} + \frac{\sqrt{3}}{2}i \end{aligned}$$

(c)

$$\begin{aligned} \cos z = 2i \sin z &\iff \frac{e^{iz} + e^{-iz}}{2} = 2i \frac{e^{iz} - e^{-iz}}{2i} = e^{iz} - e^{-iz} \iff e^{iz} = 3e^{-iz} \\ &\iff e^{2iz} = 3 \iff z = \frac{1}{2i} \log 3 = \frac{1}{2i} (\ln 3 + 2k\pi i) \\ &\iff z = k\pi - \frac{\ln 3}{2}i, \quad k = 0, \pm 1, \pm 2, \dots \end{aligned}$$

4. (3 marks) Suppose $u(x, y)$ is harmonic $\forall (x, y)$ and $v(x, y)$ is a harmonic conjugate of $u(x, y)$. Show that $u^2(x, y) - v^2(x, y)$ is harmonic $\forall (x, y)$.

Solution: $f(z) = u + iv$ is entire $\implies f^2(z) = u^2 - v^2 + 2uvi$ is entire $\implies u^2 - v^2$ is harmonic $\forall (x, y)$.

5. (6 marks) Describe the image of the rectangle $\{z \mid 0 \leq x \leq 1, 0 \leq y \leq \pi\}$ under the mapping $f(z) = e^z$. Hint: plot the images of the curves $x = \text{constant}$, $y = \text{constant}$.

Solution: $f(z) = e^z = e^x e^{iy} = u + iv$, where $u = e^x \cos y$ and $v = e^x \sin y$. Therefore the image is the half annulus $\{u + iv \mid 1 \leq \sqrt{u^2 + v^2} \leq e, v \geq 0\}$.
